

SPECIFICATIONS Patching Adapter™

The Patching Adapter™ includes (6) 1/4" phone jacks in parallel. This unit can be one of the most useful "tools" available for patching systems together when "Y" connectors are needed.

Actually, the Patching Adapter is a six-way "Y" connector which may be used for channel grouping of submasters or for any situation calling for paralleling of several different signals.

Be careful when paralleling outputs from mixers, effects devices, etc., because not all manufacturers provide "build - out resistors" which allow those outputs to be mixed.

Several speaker enclosures may be connected to one power amp with the Patching Adapter, but total system impedance should be considered. Speaker cables (not shielded patch cables) should be used for speaker level. Shielded cables should be used for all low level patching.

⚠ Caution: Never parallel the speaker outputs from power amps with the Patching Adapter or by any other means.
